

About the FloridaCHARTS.com Death Query System

The Death Query System provides counts and rates of deaths from 1970 to the present. Provisional data is updated every day at approximately 5:00 a.m. When final data is published for the year, the term “provisional” is removed and that data will not change.

Causes of death are provided for the [international standard diagnostic cause groups](#) (see [World Health Organization](#)) which are used to classify diseases and record many types of health and vital records including death certificates. In this system, if there are no values for the variable selected, then no data will be displayed. Where HIV disease is the cause of death and for combinations of death including this cause, only county-level geography is available. Deaths due to HIV disease are not included in city, zip code, or census tract counts. Starting with 2003, the sum of the deaths from all counties will not equal the total number of resident deaths due to an unknown county of residence on some records. [Changes and Updates](#) are included at the end of this document.

Recorded Deaths	Count Query	Deaths in Florida, regardless of whether the decedent was a Florida resident
Resident Deaths	Count Query	Deaths to Florida residents
Resident Maternal Deaths	Count Query	The World Health Organization defines a maternal death as the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. In the Death Query System, maternal deaths are defined according to the International Classification of Diseases Coding in effect at the time based on year of death as follows: in 1970-1978 using ICD8 630-678; in 1979-1998 using ICD9 630-676; in 1999-present using ICD10 A34, O00-O95, O98-O99.
Resident AADR (Age Adjusted Death Rate)	Rate Query	Age-adjusted death rates control for differences between populations due to age. For example, a county with a younger population may be expected to have fewer cardiovascular disease deaths than a county with an older population. Comparing these counties using age adjusted death rates will adjust for this difference. Age adjusted rates are calculated using the Year 2000 Standard Population Proportion. Population estimates are provided by the Florida Legislature, Office of Economic and Demographic Research.
Resident Crude Death Rate	Rate Query	Crude death rates are usually expressed per 1,000 or per 100,000. Crude death rates are calculated by dividing the number of deaths by the estimated mid-year population, then multiplying by 1,000 (or by 100,000). Some causes of death, such as malignant neoplasm of the prostate, occur only for males or females. Crude death rates for these causes are calculated using the mid-year population for the appropriate gender.
Resident Maternal Death Rate	Rate Query	The maternal death rate is the number of maternal deaths divided by the number of live births in the same period of time X 100,000.
Resident YPLL Rate (years of potential life lost)	Rate Query	YPLL, years of potential life lost, is an estimate of premature mortality that has been defined as the number of years of life lost among persons who die before a predetermined age. In the case of FloridaCHARTS.com, that age is 75. This YPLL rate is calculated in the following manner: <ol style="list-style-type: none">1. Calculate (75 – age at death) for all deaths that occurred for a specific cause in a certain county2. Add the results of this calculation and calculate a rate per 100,000 population under 75 (A YPLL rate is a type of crude rate). Note: Deaths that occur at age 75 or greater are excluded from this calculation.

50 Leading Rankable Causes of Death	<p>To provide a consistent grouping and ranking standard, the National Center for Health Statistics (NCHS) prepared a List of 113 Selected Causes of Death and designated 50 of these causes as eligible to be ranked as leading causes of death. These are the National Center for Health Statistics' 50 leading rankable causes of death which are presented in a single hierarchal level. This also includes a group called 'other non-rankable cause of death' which is provided in order to sum the total number of deaths. Listed with the cause groups are the ICD-10 codes.</p> <p>Ranking causes of death is a standard method for presenting mortality statistics. This method has been used for over 50 years to show the most frequently occurring causes of death and their relative impact. All states use a standard method used to classify causes of death. Periodically, the cause of death lists are updated based on the International Classification of Diseases (ICD).</p> <p>Available from 1970 forward.</p> <p>See tables that follow for details including ICD codes.</p>
Resident Census Tract by County (Death Count Query only)	<p>Census tracts are displayed initially by county and can be expanded to display census tracts. Data are available by census tract for Florida residents for 1995 forward. Rates are not available for this level of geography due to limitations on accurate population counts by census tract. The link below provides a census tract and related demographic information based on a street address:</p> <p>https://geomap.ffiec.gov/FFIECGeocMap/GeocodeMap1.aspx</p>

Cities are rolled up by county in the initial presentation.</p> <p>Rates are not available for this level of geography due to limitations on accurate population counts by city. Cities included are for incorporated cities of 2,400 or more population. Deaths that occurred outside of city limits are included in a group called "Balance of County".</p>

Cause of Death Classifications

The underlying cause of death is determined from death certificate medical information in accordance with procedures established by the World Health Organization (WHO) and the National Center for Health Statistics (NCHS). Standardized codes are assigned from the International Classification of Diseases (ICD). To keep abreast of changes in medical knowledge, the ICD is revised approximately every 10 to 15 years. Revisions and years used in Florida are:

Revision	Years Used
Second	1917-1920
Third	1921-1929
Fourth	1930-1940
Fifth	1941-1948
Sixth	1949-1957

Revision	Years Used
Seventh	1958-1967
Eighth	1968-1978
Ninth	1979-1998
Tenth	1999-Present

Due to these revisions, some of which involve major changes, year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used, or in which the changes from one revision to another were minor. The Tenth Revision contains major modifications in many sections. Under the Tenth Revision, a disease category such as "pneumonia/influenza" may be redefined so that more or fewer deaths are included in that classification. To permit more accurate comparisons, NCHS coded a sample of 1996 US deaths by both the Ninth and Tenth Revision rules. The results were grouped by major causes and, for each of these; the number of Tenth Revision deaths was divided by the number of Ninth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Malignant Neoplasm is 1.0068. This means the Tenth Revision coding of 10,000 death certificates will produce about 68 more Malignant Neoplasms than the Ninth Revision coding would. The comparability ratios for 113 selected causes of death and the 130 selected causes of infant death may be found in the National Vital Statistics Report, Vol. 49, No. 2, May 18, 2001 available at http://www.cdc.gov/nchs/data/nvsr/nvsr49/nvsr49_02.pdf.
